

I am Jose Guerra, a current undergraduate in biochemistry at UNLV. My academic goals are to complete my Bachelor of Science in biochemistry and complete two minors, one in neuroscience and the other in computer science. After I would like to enter a bioengineering program out of state and still do research. As for my career, I was heavily leaning towards research, I can see myself working in this field and enjoying it for the rest of my life.

My goal for this research project is to apply my knowledge from a multidisciplinary background as well as isolate a phenotype that can occur due to exposure in a near-zero magnetic field environment.
